

Status update on the internal parallel run and timeline

- Parallel run setup is depicted in the image below
- The **process** captured in the red rectangle runs smoothly

Status update on the internal parallel run and timeline

- The TSO and NorCap data delivery has reached a stable ground
- Whereas the internal parallel run process in the red box (on the previous slide) runs well from a process point of view, the next focus needs to be on the content:
 - The domain validation to be performed by the TSO operators
 - The market simulations by the SAWG
- The SA WG had limited opportunity to perform market simulations up to the moment of sharing these slides
 - This is due to continuing issues in the simulation facility (SF), impacting all the SF users (such as the Core region)
 - Those issues started in July (basically after the Interim Coupling Project) – Solved late August.
